

# Determinants

## Singular transformation

if matrix is singular, if we implement transformation new matrix does not cover entire plane (space)

## Rank of linear transformations

singular

non-singular

non-singular

# Determinant as an area

Non-singular

	
3	1
1	2

Determinant = 5

Area = 5

Singular

	
1	1
2	2

Determinant = 0

Area = 0

Singular

	
0	0
0	0

Determinant = 0

Area = 0

determinant indicates change of volume of space. if  $\det = 2$ , that means space grow 2 times

if determinant is non-zero then our matrix is non-singular

## Determinant of a product

$$* \det(AB) = \det(A) \cdot \det(B)$$

# Eigenvalues and Eigenvectors → extremely important for PCA

Every point in the space can be expressed as a linear combination of elements in the **basis**

**Span** is basically set of points that can be reached with direction of basis vectors in any combination.

## Eigen basis

Some basis are more useful than others. but eigenbasis is the most useful among them  
eigenbasis is basis of eigenvector

2	1
0	3

3	0
0	3

these two transformations are not the same but they act the exact same way for a specific line. And we call this line as **eigen vector**, and **eigenvalue** as value of change of this vector in transformation

exmp: find eigen values and eigen vectors of this matrix :  $\begin{bmatrix} 9 & 4 \\ 4 & 3 \end{bmatrix}$

first step  $\begin{bmatrix} 9 & 4 \\ 4 & 3 \end{bmatrix} - \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix} = \begin{bmatrix} 9-\lambda & 4 \\ 4 & 3-\lambda \end{bmatrix}$

second step  $\det \begin{bmatrix} 9-\lambda & 4 \\ 4 & 3-\lambda \end{bmatrix} = (9-\lambda)(3-\lambda) - 4 \cdot 4 = 0$   
 characteristic polynomial

eigenvalues  $\begin{cases} \lambda = 11 \\ \lambda = 1 \end{cases}$

third step  $\begin{bmatrix} -2 & 4 \\ 4 & -8 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix}$

$\begin{bmatrix} 8 & 4 \\ 4 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} \dots$
